

SYSTEM AND METHOD FOR DETECTING TAMPERING IN A GAMING MACHINE

ABSTRACT

5 This document discusses, among other things, a system, method and kit for
detecting tampering within a self-service machine having a housing. An emitter and
a sensor are mounted to the housing and to an object positioned in relationship to
the housing such that radiation generated by the emitter falls on the sensor when the
object is in a particular position with respect to the housing and to a lesser extent
10 otherwise. A signal is generated and the emitter is driven with the signal. The
signal is modified and the sensor is monitored for the modified version of the signal.
An alarm is generated if the modified version of the signal is not detected.
